ClearView® Video Quality Analyzers
8K • 4K • HD • SD • IP

VideoClarity
Tools for Video Analysis
ClearView is a highly advanced test & measurement analyzer providing source and processed video recording, file importing, automatic alignment, and a variety of quality metric assessments for any content resolution or frame rate. Comparative playback modes are a unique feature applied up to 8K ultra high definition uncompressed sequences.* This combination of quality analysis features allow users to effectively quantify the human subjective experience.

The emergence of new and diverse media consumption devices creates a need for varied resolutions and processing methods to all screens - TV, PC, and mobile. Therefore, the requirements of digital content distribution have increased dramatically. Evolving and potentially concatenating compression technologies from JPEG 2000 or XS through MPEG H.264, HEVC, VVC, or AV1/2 create an intense need for tools that can properly analyze and track results.

Today's digital media can be produced and delivered at very high resolutions and frame rates assuming that one has the storage space and the required throughput via the chosen delivery network such as satellite, internet, cable, cellular, or over-the-air broadcast. Each method presents unique characteristics and limitations. Therefore, the most challenging task for product developers, content originators, and media delivery networks is to create a product or service that can fit as many programs as possible into the available bandwidth at the highest quality while avoiding low quality.

To this end, some form of human perceptual video and audio quality analysis must be done with two requirements in mind.
- In-depth assessment of video content having differing complexity characteristics with multiple digital processing attributes and possibly varied distribution methodologies
- Long-duration tests searching for signal drops and to track degradation in quality over hours, days, or even weeks

For most entities, creating a proper and comprehensive human subjective study of video quality would be a difficult and expensive endeavor. It generally requires setting up a controlled environment and collecting human observers who are able to consistently evaluate picture quality for a varied set of video content. Fortunately a number of algorithms with specific metric characteristics have been developed to estimate human perceived quality with a very high correlation to correctly produced human subjective study data which follow either the ITU-R BT.500.13 or the ITU-T P.913 recommendations.

ClearView full-reference metrics:
- VMAF: Video Multimethod Assessment Fusion is tailored for quality assessment of streaming video services
- MS-SSIM/DMOS: Multi-Scale Structural Similarity Image Quality Assessment on both MS-SSIM and DMOS scales, where DMOS is the difference between the mean opinion scores of the reference and processed video
- ΔE_ENV: Provides an objective assessment of whether a difference between two colors may be visible between two versions of a given program
- JND: The number of human observers that must be gathered to end up with at least one person who believes that the processed video is at least as good as the reference (just noticeable differences)
- PSNR: Peak Signal-to-Noise Ratio, the ratio between the maximum possible power of a signal and the power of distorting noise affecting the fidelity of its representation
- aFREQ: Audio performance metric for finding low quality versus each reference audio channel. aFreq includes an audio-video offset measurement or lip sync value for a selected channel in program

ClearView no-reference metrics:
- CAMBI: Video banding detection and visibility metric, also operates as full-reference in ClearView
- NIQE: Natural Image Quality Evaluator, a completely blind, distortion free, no reference, image quality assessment index
- aPEAK: True-peak audio measurement per channel according to ITU-R BS.1770-4
- LKFS: Audio loudness measurement per program according to ITU-R BS.1770-4
- Spatial: Calculates the activity power of a video frame, a higher number indicates more changes in the frame
- Temporal: Calculates the changes between successive video frames, a zero indicates a frozen frame

*Sequences in ClearView may be comprised of video either with or without audio, VANC, and timecode of any duration.
PSNR: One of the most widely used metrics is PSNR (Peak Signal-to-Noise Ratio). It measures the mean error between input and output expressed as a ratio of the peak signal in dB. PSNR, while not performing a human perceptual video quality prediction, does serve an important role as one of the objective metrics included in all ClearView systems. PSNR is important for device performance or network path testing when a PASS/FAIL indicator is needed and as complement or alternative to perceptual metrics when picture processing performance is near or above the limit of human perception.

NIQE: Natural Image Quality Evaluator is a completely blind, distortion free, no reference, image quality assessment index. This quality evaluator by University of Texas LIVE is of a natural scene statistic (NSS) based modeling framework for an opinion unaware (OU) and distortion unaware (DU) no-reference (NR) image quality assessment (IQA). The result is no-reference IQA model not requiring previous distorted image exposure nor any training on human opinion scores. The NIQE quality index performs better than PSNR and the non-multi-scale structural similarity (SSIM) index.

CAMBI: Contrast-aware Multiscale Banding Index operates as a no-reference banding detector in ClearView similarly to other included no-reference quality indices. CAMBI, designed by Netflix, may be operated as full-reference with an added log entry for CAMBI difference scores between source and downstream versions. Banding artifacts are visible contours arising from the quantization of a smooth region in a video. To create a banding visibility score, CAMBI extracts multiple pixel-level maps at multiple scales, for temporally sub-sampled frames of previously encoded video, and subsequently combines these maps into a single index using properties of the human Contrast Sensitivity Function.

VMAF: This full-reference metric is also designed by Netflix and implemented on its native scale in ClearView according to the latest published VMAF version. VMAF closely approximates human perception of video quality and is consistent across content types whether for natural videos or animated content. VMAF is particularly tuned to assess quality of video streaming by taking various source content characteristics into account and by focusing on compression and picture scaling artifacts as the dominant degradation components in delivered versions of streamed content.

MS-SSIM, SSIM, and DMOS: In Multi-Scale Structural Similarity Image Metric (MS-SSIM), the picture is evaluated at various resolutions and the result is an average of these calibrated steps. MS-SSIM out-performs simple SSIM even when the SSIM is correctly calibrated to the environment and data set. ClearView includes MS-SSIM and SSIM, developed by the University of Texas, and provides both on their native scales with MS-SSIM also mapped to a linear DMOS (Differential Mean Opinion Score). The measurements may be performed on luma and a combined score is provided for color channels.

ΔEITP: Following ITU Recommendation BT.2124, ΔEITP is useful to assess the potential visibility of color differences in HDR television images and signals. The metric returns a just noticeable difference (JND) score that provides an assessment of the differences introduced by video processing techniques versus camera original content.

Sarnoff JND: A ClearView option, the Sarnoff JND Vision Model is a highly accurate predictor of perceptual quality in video. It includes the Picture Quality Ratio (PQR) algorithm and is quantified in units of JND (Just Noticeable Difference).

Audio Performance Measurements - Included In All ClearView Models

- aFREQ - Audio Frequency Metric - Gives a comparison of audio versus a reference to find gross audio errors and provide a general performance comparison of source audio channels to processed audio channels.
  - The audio/video offset (lip-sync) is also calculated to the millisecond as part of the aFREQ metric.

- aPEAK - Audio Peak Metric and Loudness Measurement - Measures the true-peak amplitude, providing a value for each frame and a separate value for each channel. Within the aPEAK measurement there is a selection for LKFS, Loudness, K-weighted, relative to Full Scale. LKFS provides a measurement that defines peak loudness over a one second period over all audio channels in a given program and responds with one value over that period. The values returned are based on a logarithmic scale with 0 being the maximum value and -60 being close to silence. The LKFS measurement follows recommendation ITU-R BS.1770-4.
ClearView Subjective Viewing Modes

The best way to visually assess an original source versus its processed version is to look at them on one video display. Using two different displays, even of the same type, requires vigilant calibration. Therefore, ClearView applies comparison viewing modes to its video outputs that play two uncompressed sequences on one video display. These modes can also be played to a window on the desktop.

- In side-by-side and split-mirror modes the sequences can be panned left or right to show any half of each image.
- In seamless split mode a line is drawn between the two sequences being compared that can be move left to right or up and down to compare different parts of each.
- Each view mode’s split points can be moved interactively during play or pause modes.
- Split mode is selectable as horizontal or vertical and view mode can be set for playback to two different displays.

Video sequences can be further analyzed as follows:
- Zooming into any picture area up to 16x
- Panning within the picture during zoom or split screen
- Identifying luma and chroma pixel values via mouse click
- Playing odd or even fields sequentially to find processor cadence differences to original video

Using the included command line interface, play lists can be created to allow any view mode to be executed in a series.

ClearView A minus B: An easy way to view pixel intensity differences between two images.
- Below, a straight subtraction shows one pixel level intensity which may not be possible with some displays.
- Therefore, ClearView systems include A minus B with a Threshold and Addback command allowing users to see differences that are greater or less than a specific pixel intensity threshold as a selectable color.
- This also allows edge differences to stand out.

A minus B with Threshold = 20 View Mode

These views are all completely interactive for play, jog, pause, zoom, or picture scroll using desktop controls and mouse movements while being fed to the ClearView system’s full resolution video outputs or, selectively, to a separate desktop window.
Equipment Manufacturers want to accelerate the development of their processing algorithms along with comprehensively testing encoder and receiver-decoder products. ClearView allows developers to measure the performance of their devices for image and sound quality quantitatively and visually judge picture quality by providing detailed test results and instantly reviewable video recordings.

ClearView
- Imports many compressed or uncompressed media file types partially listed on page nine
- Records video and audio using baseband inputs such as 12G-SDI, IP for SMPTE ST 2110, or HDMI along with up to sixteen channels of digital audio and ancillary data
- From an MPEG IP stream it demultiplexes, decodes, and records the targeted stream for testing

Whether the sequence is imported as a file or recorded, content is stored as uncompressed YCbCr 4:2:2 or RGB 4:4:4.

ClearView can then...
- Automatically align the two sequences spatially and temporally using a choice of methods
- Provide a subjective comparison of the two sequences using any of the viewing modes previously shown
- Score the video quality using objective methods VMAF, MS-SSIM/DMOS, ΔEITP, JND, PSNR, and NIQE
- Apply the aFreq audio performance metric on up to sixteen audio channels

All test measurement scores are saved to a text log file. The log file test data is automatically compiled and graphed with other score data by using the included Metric Log Grapher tool and log files can be dropped onto the ClearView GUI to restore the test session with both video sequences recalled for review.

ClearView workflow examples:
1) Capture a sequence via 12G-SDI, HDMI, ST 2110 IP, or MPEG IP network to ClearView then output from ClearView to an encoding process. Simultaneously record the transmitted output from a decoder or from an IP network directly.

2) Send a repeatable sequence to the network or processing unit, record the output from an IP network or a hardware decoder via SDI or HDMI and compare this to a pre-recorded or a simultaneously recorded live reference video. After recording and automatic alignment, ClearView generates pass/fail to a log file or command-line script. This can then be followed by instantly recallable playback review of network or device under test failures shown compared to the source video in various view modes as described on page three.
**Content originators and entertainment service providers** want to determine the optimal parameters to fit as many channels or streams into the delivery network as possible and reach an acceptable quality level. They also want to check the quality of the material after it has been compressed and/or transmitted through a distribution network. ClearView provides both uncompressed 12G-SDI or ST 2110 input and output support as well as compressed IP network input decoding for its uncompressed quality measurement operation.

In this example the ClearView system...
- Plays an uncompressed sequence through IP network as ST 2110 media
- Records simultaneously from uncompressed ST 2110 network or decodes processed video from an MPEG IP feed
- Aligns spatially & temporally via single or multi-frame method or a frame for frame Exhaustive Alignment routine
- Scores the video quality using VMAF, MS-SSIM/DMOS, JND, NIQE, PSNR, and audio quality with the aFreq metric
- Produces delimited text log files where results can be examined as is or graphed automatically with Metric Log Grapher
- Recalls any test along with its synchronized side-by-side audio/video comparison from a drag-n-drop of its test log file as shown on page three

A ClearView system option for use by manufacturers, broadcasters, or any media service provider is **RTM**. The RTM application monitors picture and sound quality and records performance faults automatically via user set thresholds for each test. It detects all content specific, continuous, or intermittent effects on audio or video quality.

RTM and **RTM 4K** - full reference audio/video quality monitoring with error segment recording*
- Inputs source “reference” and downstream “processed” A/V through 12G-SDI, HDMI, ST 2110 or MPEG IP
- Measures the video quality as PSNR or MS-SSIM on the DMOS scale in real-time from live inputs
- Measures the audio quality and audio/video offset (lip-sync) at the same time down to the millisecond
- Measures the audio loudness according to ITU-R BS.1770-4
- Measures each VANC line or IP media ancillary data for integrity with each data item individually selectable
- Continuously reports min, max, and average A/V quality and A/V offset to text logs and to the RTM Manager
- Records the failed portions of the A/V sequences and alerts the user via GUI or RTM Manager if any of the tests applied have fallen below a user-set degradation threshold

---

*RTM Software is optionally provided with ClearView in the same system. See the RTM, RTM-4K, RTM Software, and RTM Manager product brochures for full feature descriptions.
Automatic Alignment Of Source And Processed Videos
- ClearView systems have the unique ability to apply several alignment methods
- Either “single frame”, “intelligent” multi-frame, or “exhaustive” alignment are selectable
- Exhaustive alignment is applied when unpredictable amounts of dropped or frozen frames occur in the processed video for which ClearView will provide a count and then eliminate from a test score by providing a newly matched source and processed video

Subjective Viewing Modes On Desktop Or A Selection Of Outputs
- Play sequences to a separate window on the desktop or out to a video monitor
- Outputs are system dependent and include 12G-SDI, HDMI, and ST 2110 on IP

Quality Metrics And Performance Measurements
- VMAF: High accuracy quality assessment optimized for streaming with 0-100 scale
- MS-SSIM: Emmy winning metric provided on linear DMOS and native MS-SSIM scales
- CAMBI: IVideo banding detection and visibility metric on its native scale
- ΔΕITP: To assess the potential visibility of color differences giving a JND score
- NIQE: Natural Image Quality Evaluator, a blind image quality assessment index
- Sarnoff JND: PQR metric on the Just Noticeable Differences scale (optional item)
- PSNR: Peak signal-to-noise ratio, in decibels, providing 0 to 100 scale
- Spatial: Calculates the activity power of a frame within the frame
- Temporal: Calculates the changes between successive frames
- aFREQ: Audio Frequency conformance measurement to find gross errors in audio performance versus a reference, provides lip-sync measurement in milliseconds
- aPEAK: True-peak audio measurement per channel according to ITU-R BS.1770-4
- LKFS: Audio loudness measurement per program according to ITU-R BS.1770-4

Test Score Analysis
Log files contain the quality scores and information about each test’s setup
- Metric Log Grapher creates multiple test comparisons
- Drag & drop log files back to ClearView to recall previous tests and comparison views
There are several ways to record live A/V sequences into ClearView. All ClearView systems provide a combination of uncompressed SDI or IP network video/audio inputs as well as compressed IP input capabilities. Video interfaces are 12G-SDI, 3G-SDI, or IP as 25G Ethernet. All systems include Gigabit Ethernet for compressed IP input with automatic decoding of MPEG video streams. All interfaces provide one or two live input recording as outlined below.

SDI or SMPTE ST 2110 Network Inputs
ClearView systems hold several options for uncompressed video with audio source recording. Record section drop menu allows a selection of single input, dual input or simultaneous output/input modes and the configuration menu options are tailored to the input interfaces installed in your ClearView model.

The functions control either the SDI, ST 2110 IP, or HDMI inputs.

ClearView systems automatically detect the input format for record operations. Sequences are stored as unmodified, fully uncompressed video and audio with support for Dolby® audio then saved for instant recall and playback operations from a user created ClearView library showing a thumbnail view of recorded sequences.

IP Input - Ethernet Stream Recording From MPEG IP Networks
Record 1 IP Input - A single input mode that records a video sequence as sensed at the IP multicast address and port specified within the IP configuration menu as pictured to the right. **IP Input, if MPEG, decodes up to two HD video feeds.**

Record 2 Inputs - Select two IP streams whether from MPEG IP compressed media or in combination with ST 2110 network of uncompressed media. Compressed media is automatically decoded and inputs may be a mix of the two networks to record sequences from two points in a delivery chain. Each input selection provides individual menus to set up MPEG IP input parameters.

Record While Playing - In this mode the ST 2110 IP or SDI output selection will play a sequence loaded into Viewport A for input to a IP network processor or device under test with an IP output. The ClearView IP input can then simultaneously decode and capture the processed MPEG IP stream as uncompressed video up to HD video resolutions with up to sixteen channels of audio.

From ClearView
The ClearView Output tab has several features which provide an ability to internally copy sequences, optionally with burned in frame numbers to facilitate frame tracking. Sequences containing Dolby audio can be automatically trimmed to match packet boundaries in order to eliminate the potential for audio artifacts or discontinuities while playing sequences in a loop. The ClearView Output tab also continues to provide the unique ability to copy a sequence to a new length or a combination of two sequences set into any View Mode so that selected picture comparisons can then be recorded and exported as a single sequence a raw formats or QuickTime movies for external review by most of today’s computer desktop players.
ClearView Importer Highlights
- Wide range of supported video and audio formats
- Fast audio and video decoding speed
- Detailed file import source information with video window
- MPTS import with program stream selector-decoder
- Easy source length import modification
- Detailed per pixel source cropping
- Image quality, size and positioning adjustment
- Up to 16 channels of audio decoding
- Command Line and GUI user interface

User controllable file adjustments:
- Import HDR video in BT.2020 (PQ) or BT.2100 (HLG)
- Import IcTcP native color format or record it from HDSDI
- Decoded or imported frame size, rate
- First/last frames to import
- 3:2 pull down insertion or removal
- Native bit depth import of 8, 10 or 12 bit video
- Crop source with input values
- Scale video resolution up or down to x, y / w, h
- Variable image and canvas resolution
- Truncate to legal broadcast values (yes/no)
- Import audio and closed caption data

Import File Formats (partial list):
- Accom YUV CCIR 601 8-bit
- ARI Raw Bayer Pattern
- Avid AVR, DS HD/SD, DV (*.gen), DNXHD
- Avid Meridian, Y’CbCr, OMFI (*.omf, *.omfi)
- AV1, AVC, AVC-HE, AVS
- Cineon (*.cin), CineWave
- DPX RGB 8, RGB 10, Y’CbCr 4:2:2
- DV (*.dv, *.dif), Digital Negative (*.dng)
- DVS Direct File Format (*.dvs)
- DVSD, DV25, DV50, MPEG-I, mJPEG, DigiSuite
- GXF Format/SMPTE-360 (*.gxf)
- H.261, H.263, H.264, H.265, HDV
- Headerless/Raw (*.hdr, *.yuv, *.rgb, *.raw)
- H.265 SLM SRFB format (*.sbf)
- Image (*.gif, *.jpg, *.png), Jaleo (*.js), JFIF, JPEG
- JPEG2000, LXF, Meridian, Media 100 MPEG
- Microsoft AVI (*.avi), BMP, DIB Files (*.dps)
- MJPEG, MPEG 1 4:2:0 (*mpg, *mpeg)
- MPEG-2 Elem. Stream, (4:2:0/4:2:2), MPEG2 (*.m2v)
- MPEG-2 Program Stream, (4:2:0/4:2:2)
- MPEG-2/4 in Transport Stream, 4:2:0/4:2:2
- MPEG-2/4 in MPTS (4:2:0, 4:2:2), MPEG-4 (*.m4v)
- MPEG-4 AVC Elementary Stream 4:2:0/4:2:2 (*.h264)
- MPEG-H HEVC/H.265 4:2:0 Main Profile (*.h265)
- MXF Format (DCP, DV, DVCPro50, MPEG, IMX, OP1a)
- Newtek Video Toaster (*.rtv)
- Phantom Support (*.cine), Photoshop Filmstrip (*.flm)
- Photo CD PCD, Photoshop PSD, Portable anymap PNM
- Portable Bitmap Format PBM DPS
- Portable graymap PGM
- Portable pixmap PPM
- QuickTime Movies (*.mov)
- QuickTime formats w/proper codec, ProRes, etc...
- RealVideo (*.ra, *.rm, *.ram), Red Camera Stream (*.r3d)
- Run-Length encoding (rle)
- Sony XDCam, SGI Movie Format (*.mv), SGI RGB
- Silicon Image Bayer (*.siv), Sun Raster (*.ras)
- Targa TGA, ICB, VDA, VST, Targa 3000, TIFF, TIF
- Targa v210 Y’CbCr 10 Bit, VC-1 Pro, VP8, VP9, Viewstore (*.vsr)
- vcap, vcap10, Windows Media (*.asf, *.wmf, *.wmv)
- Y’CbCr 8/10, Y’CbCr, RGB, YCrCb 8/RGB

Audio Import Formats:
- Dolby Digital Plus Professional Input Decoder
- MPEG-2 Layer 1 (*mp1)
- MPEG-2 Layer 3 (*mp3)
- Waveform Audio (*.wav)
- Adaptive Multi-rate (*.amr)
- Audio Interchange File Format (*.aiff)
- Windows Media Audio (*.wma)
- Advanced Audio Coding (*.aac)

Export File Formats:
- BMP, Headerless/Raw (*.yuv, *.rgb, *.raw)
- Microsoft AVI (*.avi), MXF (v210)
- QuickTime with up to 16 audio channels

*ClearView Importer is an option in the ClearView QA system.

**WFM - Waveform Monitor / Vectorscope**

ClearView systems may include WFM, a comprehensive option for video input and output specification display.

**Waveform Monitor** - Displays the levels of the Y, Cb and Cr from the left of the picture to the right of the picture with all the lines summed into one graph.

**Vectorscope** - Depicts a traditional Cb by Cr X-Y display with overlaid reference graticule. Color accurate graticules automatically switch between SD, HD and UHD color spaces.

**Chromaticity Scope** - Provides a visual representation of the color in a video across all the colors of visible light. For a particular Y’CbCr range (BT.2020, Rec.709, CCIR-601) a triangle can be super imposed.

**Histogram** - Provides an overview of the tonal range of each color in the picture.

**Picture View** - Shows the video signal to confirm the source is correct and to display time code location.

**Data View** - Allows access to the raw pixel values being monitored on the HDMI or SDI input.

---

WFM option is compatible with most ClearView system configurations.

*Option*
ClearView Extreme 8K and 4K Systems

Storage on 8K Models: 12 or 24 TB
Storage on 4K Models: 8, 16, or 32 TB
Power: 100 - 240VAC, 47-63Hz, Autodetect, 600 Watts Max
Desktop Outputs: HDMI, or DP (2)

Physical Specifications:
- Dimensions: 17” W x 5.25” H x 20.15” D
- Weight of 8K: 36 lbs, 16.4 Kg
- Weight of 4K: 31 lbs, 14.1 Kg

Temperature:
- Operating: 0 - +40 Celsius
- Rel Humid: 5-95%, noncondensing

Additional Options:
- CV-JND - JND metric
- CV-RTM-4K - RTM Software
- CVVP-4K-1L - Venue Player

ClearView Extreme 8K: Models CV-S8085-8K-12, -24, -48, or -96

A/V Interface: CV-SDI-I0-12G (1)
Accessories: S3U rack kit, keyboard, mouse, monitor boot drive, PDF system guide, cable kit for CV-SDI-I0-12G

Play/Record Duration Examples (12 TB):
- Duration: 141 min.

ClearView Extreme Uncompressed Interface Options

Applicable Option Modules:
- CV-IP-IO-UHD module option:
- 2 additional per 4K, 1 additional per 8K

ClearView Extreme 4K: Models CV-S8085-4K-8, -16, -32, or -64

A/V Interface: CV-SDI-I0-12G (1)
Accessories: 3RU rack kit, keyboard, mouse, monitor boot drive, PDF system guide, cable kit CV-SDI-I0-12G

Play/Record Duration Examples (8 TB):
- Duration: 375 min.

ClearView Extreme 4K: Additional Video Capacity Examples

Play/Record Duration Examples (16 TB):
- Duration: 374 min.

Play/Record Duration Examples (32 TB):
- Duration: 1500 min.

ClearView Shuttle 4K Systems

Storage: 4.0 TB
Power: 100 - 240VAC, 47-63Hz, Autodetect, 300 Watts Max
Desktop Outputs: DVI, DP, or HDMI

Physical Specifications:
- Dimensions: 8.6” W x 3.5” H x 17.5” D
- Weight: 11.5 lbs, 5.4 Kg

Temperature:
- Operating: 0 - +40 Celsius
- Rel Humid: 5-95%, noncondensing

Additional Options:
- CV-JND - JND metric
- CV-RTM-3G - RTM Software
- CVVP-4K-1L - Venue Player

ClearView Shuttle 4K: Model # CV-S2045

A/V Interface: CV-SDI-I0-12G (1)
Accessories: Hard travel case, keyboard, mouse, OS recovery disk,
PDF system guide, cable kit, rack ears

Play/Record Duration Examples:
- Duration: 47 min.

ClearView QA: HD and SD Test System

Storage: 4.0 TB
Power: 100 - 240VAC, 47-63Hz, Autodetect, 300 Watts Max
Desktop Outputs: DVI, DP, or HDMI

Physical Specifications:
- Dimensions: 8.6” W x 3.5” H x 17.5” D
- Weight: 11.5 lbs, 5.4 Kg

Temperature:
- Operating: 0 - +40 Celsius
- Rel Humid: 5-95%, noncondensing

ClearView QA with Dual 3G-SDI: Model # CV-S2043-QA

A/V Interface: CV-SDI-I0-3G (1)
Accessories: Hard travel case, keyboard, mouse, OS recovery disk,
PDF system guide, cable kit, rack ears

Play/Record Duration Examples:
- Duration: 500 min.

ClearView Systems Specifications

Display Specifications

- Digital Video: 4 HD-BNC input/output programmable - 12G-SDI, 3G-SDI, or SD-SDI
- Supports 8, 10, 12 bits - SMPTE 259, 292, 296, 424, 425a/b, 2082, 4K as 2SI
- 8K products provide up to 7680x4320p60 as Quad or 2SI on four 12G-SDI

Digital Embedded Audio:
- 16 channels - SDI embedded input and output
- 1 output, up to 4096x2160p60Hz 4:4:4 10-bits per component, Type A HDMI
- HDR Infoframe metadata compatible with HDMI 2.0a/b - CTA-861-1, CTA-861-G

Reference Input:
- Black (1V), Composite (2 or 4V), or Tri-Level Sync (1V) on 1 HD-BNC

Video and Audio Interfaces

- HDMI audio, 48 KHz, synchronous per HDMI
